# G-Real

# Network Monitoring Problem Problem Type: Vertex Cover

Our company has 8 computers connected by several communication links. These computers are named: ... ...

Problem: How can we select the minimum number of computers to deploy monitoring devices, such that every communication link is monitored by at least one device?

Communication links as follows: ... ...

I am designing a public Wi-Fi network for my city, with ... The network will cover 8 major locations in the city: ... ...

The interference relationships between the base stations are as follows: ... ...

Can you help me come up with a solution for frequency allocation to ensure stable and reliable network performance across all locations?

#### Delivery Logistics Problem Problem Type: TSP

Our company handles deliveries across a busy urban area, and today we have 7 distinct delivery points to cover ... ...

Here is the distance table showing the approximate distance (in kilometers) between each pair of locations: ... ...

Based on this distance table, we need to determine the optimal delivery route that ... return to warehouse with the shortest possible total distance.

### TIEA

**Function:** Extracts background, entities, and definitions from text to provide semantic context for problem analysis.

Tool Use: False
Output Format:

- context: The background and contextual description of the problem.
- entities: List of key entities or concepts mentioned.
- definitions: Definitions and explanations of terms involved

## **PIEA**

**Function:** Extracts problem type, constraints, and optimization objectives for graph theory solutions.

Tool Use: False

**GSIEA** 

processing.

Tool Use: False

**Output Format:** 

weight or direction

### **Output Format:**

- · objective: The goal of the problem
- · constraints: Key constraints in the problem.

Function: Extracts and standardizes graph

weights, and topology for efficient downstream

edges: Connected nodes with attributes like

data from text, identifying nodes, edges,

· nodes: List of nodes in the graph

• graph type: The type of graph

• optimization: Optimization objectives

## **GTA**

Graph Theory Knowledge Base

Function: Integrates extracted information, analyzes graph properties, and searches a Graph Theory Knowledge Base to select the optimal algorithm, enhancing inference efficiency and solution accuracy.

Tool Use: False

#### **Output Format:**

- **problem:** Type of graph theory problem.
- algorithm: Selected algorithm name.
- **parameters:** Required parameters for the algorithm.
- complexity: Time complexity of the selected algorithm.
- **description**: Why this algorithm is the best choice for the given problem.

# SGIA

**Function:** Converts textual graph data into a standardized, optimized format, ensuring consistency, efficiency, and compatibility for computational solving.

Tool Use: True
Output Format:

- graph type: The type of graph
- adjacency list: Maps nodes to their neighbors and edge weights.
- node mapping: Links node names to numerical IDs.

## ASA

Code Interpreter

Graph Theory Algorithm Library

Function: Executes the selected optimal graph algorithm by extracting and formatting required parameters, calling the Graph Theory Algorithm Library for computation, ensuring solution feasibility, and providing clear, explainable reasoning for the results.

Tool Use: True

#### **Final Solution:**

The most efficient delivery route that visits each delivery point exactly once and returns to the warehouse is:

\*\*Route\*\*: Warehouse → Gilded Archway → Jade Fountain → Zenith Arena → Primrose Boulevard → Temple Square → Pennywhistle Arcade → Lunar Pier → Warehouse

\*\*Total Distance\*\*: 34 units
This solution ensures that the delivery is conducted in the most efficient manner, minimizing travel distance.
